

Household Projections for Japan 2010-2035¹⁾

Outline of Results and Methods

Introduction

“Household Projections for Japan (Outline of Results and Methods)” project the number of households nationwide and are new household projections following the projections released in 2008²⁾. The initial population used as the benchmark of the projections was obtained by adjusting the results of the 2010 Census.

I. Framework of Projections

1. Period of Projections

The period for the present projections is the twenty-five years from October 1, 2010 to October 1, 2035.

2. Method and Results of Projections

The essential part of the household projections was carried out by the household transition method, in the same way as for the projections published in 2008. This method projects distributions by combination of future marital states and household positions, by setting probabilities of transition of members of private households, and applies them to the population by sex and five-year age group of “Population Projections for Japan (Published in March 2012)³⁾” (medium fertility/medium mortality variant) in order to project the population by sex, five-year age group, and combination of marital state and household positions. Households are identified with markers such as “one-person households,” “couple-only households,” “couple-and-child(ren) households,” “one-parent-and-child(ren) households,” and “other households.” Markers refer to members regarded as key persons in terms of household formation/dissolution in projection models and usually match with the household heads of the Census. For exceptional cases such as a wife or a child becoming the head of “couple-and-child(ren) households,” we set certain rules such as the marker of “couple-and-child(ren) households” always being the husband and the marker of “one-parent-and-child(ren) households” always being the parent. We applied the correspondence between head/non-head and marker/non-marker in 2010 to the projected population by sex, by five-year age group, and by marital state and household positions (marker/ non-marker) to obtain the number of heads by sex, five-year age group, marital state, and family type.

The detailed results of the projections are shown in Result Table 2 (number and mean size of private households by family type) and Result Table 2 (number of households by head’s sex, five-year age group, and family type).

3. Initial Population

We obtained the initial population used as the benchmark of the projections based on the 2010 Census, by converting positions of members within private households from heads/non-heads by family type to markers/non-markers by family type.

4. Variants of Projections

The present projections handle only one case. However, for reference, we also calculated the number of households under the assumption that the distributions by sex, five-year age group, and combination of marital state and household positions remain constant from 2010 and onward.

The purpose of the projections is to obtain the future number of private households by family type. This report deals with five different family types: “one-person households,” “couple-only households,” “couple-and-child(ren) households,” “one-parent-and-child(ren) households,” and “other households.”⁴⁾ (Table 1)

Table 1. Family Types in Present Projection and Census

Present Projection		2010 Census of Japan		Number of households ¹⁾
Private households	Family nuclei	One-person households	One-person on households	16,785
	Couple-only	A married couple only		10,244
	Couple-and-child(ren)	A married couple with their child(ren)		14,440
	One-parent-and-child(ren)	Father with his child(ren)		664
		Mother with her child(ren)		3,859
		A couple with their parents		232
		A couple with their parent		731
		A couple with their child(ren) and parents		920
		A couple with their child(ren) and parent		1,516
		A couple with their relative(s) other than child(ren) and parent(s)		122
Other-private-households	Relatives households	A couple with their child(ren) and relative(s) other than parent(s)		431
		A couple with their parent(s) and relative(s) other than child(ren)		106
		A couple with their child(ren), parent(s) and relative(s)		350
		Brothers and sisters only		316
		Other relatives households not elsewhere classified		586
		Households including non-relatives		456
		Students in school dormitories		7
		Inpatients in hospitals		13
		Inmates of social institutions		47
		Persons in camps of Self-Defence Forces		3
Institutional households	Institutional households	Inmates of reformatory institutions		1
		Others		39

1) In 1,000 households reported in the 2010 Census of Japan.

Households that family type is unknown (85,798 households) are not included.

II. Overview of Projection Results

1. Number of Private Household Members and Total Number of Private Households (Figure 1)

According to the Population Projections for Japan (medium fertility/medium mortality), the total population of Japan will continue declining for a long time from 2010. According to the present projections, the development of the number of private household members shows generally the same trends as the total population. As seen in Result Table 1, the number of private household members decreases year by year from 125.55 million people in 2010 to 109.09 million in 2035, which is a reduction of 16.45 million people.

On the other hand, the total number of private households, as shown in Figure 1, continues to grow from 51.84 million in 2010 to peak out at 53.07 million households in 2019. Afterward, however, the number starts to decrease and the total number of private households in 2035 is 49.56 million, which is smaller by 2.29 million than in 2010.

2. Mean Size of Households (Figure 2)

The fact that the number of households continues to increase even under the population decline implies that the household size keeps on shrinking. The mean size of private households will continue to decrease, from 2.42 members in 2010 to 2.20 in 2035.

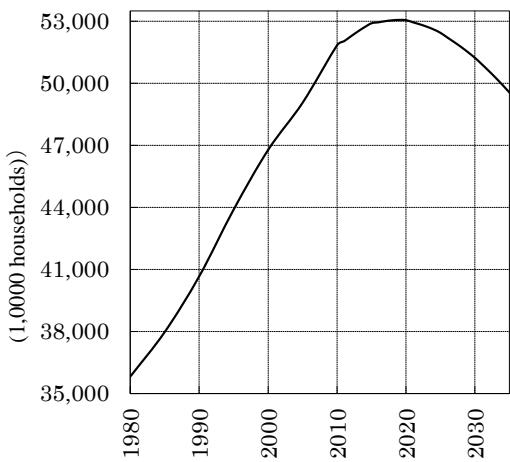

Figure 1. Total Number of Private Households

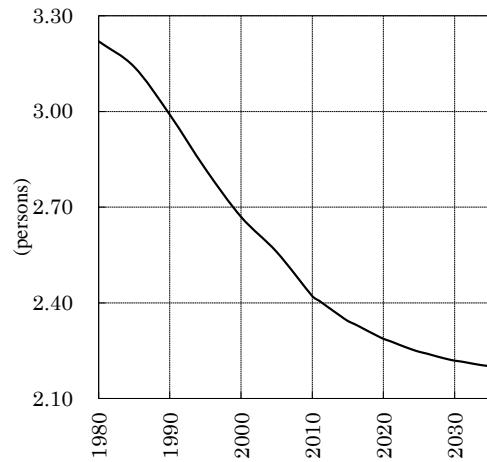

Figure 2. Mean Size of Private Households

Table 2. Number and Percentage of Private Households by Family Type

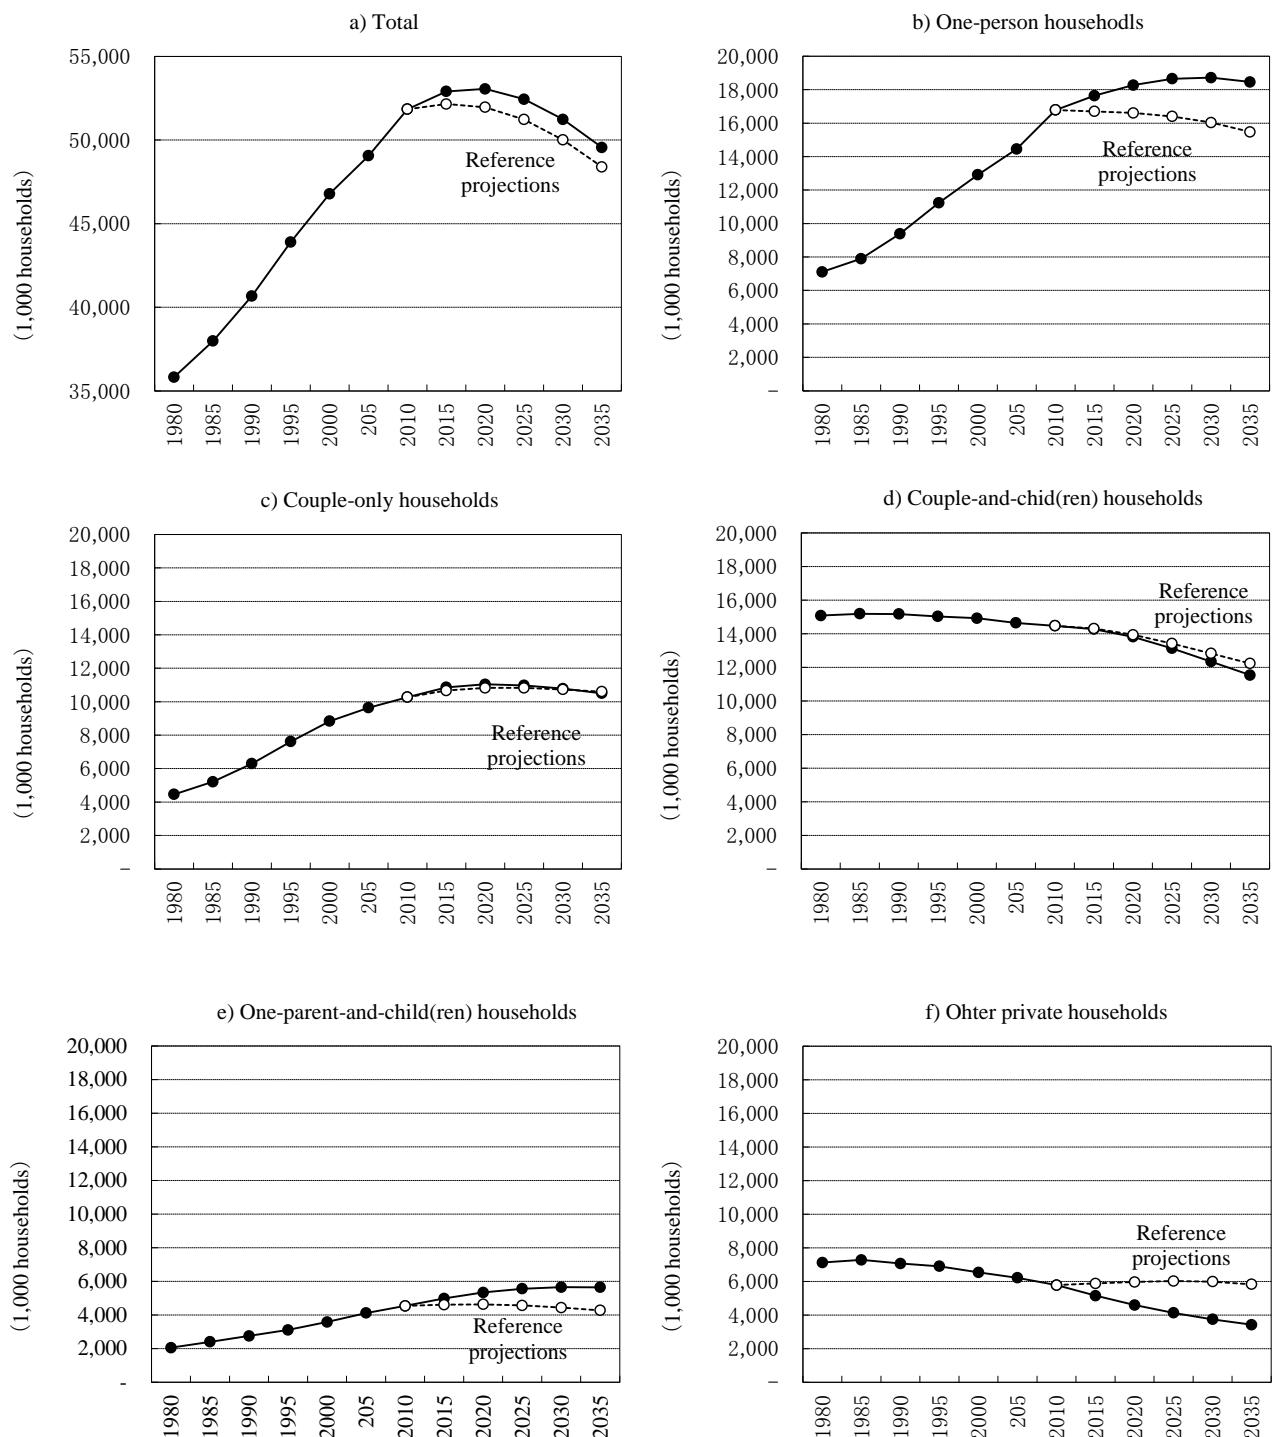

Year	Private households						
	Total	One-person	Family Nuclei				Other
			Total	Couple-only	Couple-and-child(ren)	One-parent-and-child(ren)	
Number of households (1,000)							
1980	35,824	7,105	21,594	4,460	15,081	2,053	7,124
1985	37,980	7,895	22,804	5,212	15,189	2,403	7,282
1990	40,670	9,390	24,218	6,294	15,172	2,753	7,063
1995	43,900	11,239	25,760	7,619	15,032	3,108	6,901
2000	46,782	12,911	27,332	8,835	14,919	3,578	6,539
2005	49,063	14,457	28,394	9,637	14,646	4,112	6,212
2010	51,842	16,785	29,278	10,269	14,474	4,535	5,779
2015	52,904	17,637	30,116	10,861	14,274	4,982	5,150
2020	53,053	18,270	30,189	11,037	13,814	5,338	4,594
2025	52,439	18,648	29,664	10,973	13,132	5,558	4,127
2030	51,231	18,718	28,770	10,782	12,340	5,648	3,743
2035	49,555	18,457	27,678	10,500	11,532	5,645	3,421
Percentage (%)							
1980	100.0	19.8	60.3	12.5	42.1	5.7	19.9
1985	100.0	20.8	60.0	13.7	40.0	6.3	19.2
1990	100.0	23.1	59.5	15.5	37.3	6.8	17.4
1995	100.0	25.6	58.7	17.4	34.2	7.1	15.7
2000	100.0	27.6	58.4	18.9	31.9	7.6	14.0
2005	100.0	29.5	57.9	19.6	29.9	8.4	12.7
2010	100.0	32.4	56.5	19.8	27.9	8.7	11.1
2015	100.0	33.3	56.9	20.5	27.0	9.4	9.7
2020	100.0	34.4	56.9	20.8	26.0	10.1	8.7
2025	100.0	35.6	56.6	20.9	25.0	10.6	7.9
2030	100.0	36.5	56.2	21.0	24.1	11.0	7.3
2035	100.0	37.2	55.9	21.2	23.3	11.4	6.9

Note: The total does not necessarily match exactly with the sum of individual figures due to rounding.

3. Number and Percentage of Private Households by Family Type (Table 2, Figure 3)

As shown in Table 2 and Figure 3, the number of “couple-and-child(ren) households” and “other private households” continues to decrease from 2010. The number of “one-person households”, “couple-only households” and “one-parent-and-child(ren) households” will continue to grow for several decades but finally starts declining in the 2030s..

Figure 3. Number of Private Households by Family Type

The number of “one-person households” keeps on increasing from 16.78 million in 2010 to 2030. The number in 2035 is projected to be 18.46 million, which is 1.67 million larger than 2010. Its percentage out of the total number of private households also increases from 32.4% in 2010 to 37.2% in 2035, an increase of 4.9 percent points.

The number of “couple-only households” increases for the foreseeable future, but the rate of increase is not as rapid as for “one-person households.” Moreover, the number starts to decline in 2020. That is, after increasing from 10.27 million in 2010 to 11.04 million in 2020, the number starts to decline and reaches 10.50 million in 2035. However, the percentage out of the total number of private households increases from 19.8% to 21.2% in 2035.

The number of “couple-and-child(ren) households” has been declining after 1985, and this trend accelerates in the future: the number decreases from 14.47 million to 11.53 million from 2010 to 2035. This “couple-and-child(ren) household” type used to be the most common family type, accounting for 40% or more of private households, but since then the percentage has already declined significantly to 27.9% in 2010, and is projected to decrease further to 23.3% in 2035.

The number of “one-parent-and-child(ren) households” grows from 4.54 million in 2010 to 5.65 million in 2030 and then will be stagnated. The percentage accounted for by this family type changes from 8.7% to 11.4% between 2010 and 2035.

The majority of “other households” are stem-families which consist of a family nuclei and direct ancestors or descendants. This family type, in the same way as for “couple-and-child(ren) households,” started to decline in the second half of the 1980s. The downward trend continues in the future as well and the number decreases from 5.78 million to 3.42 million from 2005 to 2035. The percentage it accounts for also declines, from 11.1% in 2010 to 6.9% in 2035.

4. Households with Elderly Heads (Table 3, Figure 4)

1) Total Number of Households with Elderly Heads

As shown in Table 3 and Figure 4, the total number of private households with heads aged over 65 years increases from 16.20 million in 2010 to 20.21 million in 2035. Households with heads aged over 75 years also increases from 7.31 million to 11.74 million from 2010 to 2035.

Since the growth rate of the number of households with heads aged over 65 years is higher than that of the total number of private households, the percentage of the households with heads aged over 65 years increases dramatically from 31.2% to 40.8% from 2010 to 2035. Moreover, the percentage of households with heads aged over 75 years out of households with heads aged over 65 years also increases, from 45.1% in 2010 to 58.1% in 2035.

2) Number of Households with Elderly Heads by Family Type

When the values of 2010 and 2035 are compared in terms of number of households with heads aged over 65 years by family type, “one-person households” shows the highest growth rate of a factor of 1.53 (an increase from 4.98 million to 7.62 million), followed by “one-parent-and-child(ren) households” with a factor of 1.52 (an increase from 1.33 million to 2.01 million). While the number of “couple-only” and “couple-and-child(ren)” households increases slightly, the number of “other private households” will decrease from 2.08 million to 1.76 million.

As for the number of households with heads aged over 75 years, all family types show greater growth compared to households with heads aged over 65 years. For example, “one-person households” grows with a factor of 1.73 (an increase from 2.69 million to 4.66 million) and “one-parent-and childr(en) households with a factor of 1.97 (from 0.67 million to 1.31 million).

Table 3. Number and Percentage of Households with Heads Aged Over 65/75 Years by Family Type

Year	Private households									
	Total	One-person	Family Nuclei				Other			
			Total	Couple-only	Couple-and-child(ren)	One-parent-and-child(ren)				
Number of households (1,000)

2010年	100.0	36.8	49.9	30.8	9.9	9.1	13.3			
2015年	100.0	37.0	51.4	31.2	10.7	9.5	11.5			
2020年	100.0	37.3	52.3	31.4	10.9	10.0	10.4			
2025年	100.0	37.7	52.4	31.2	10.9	10.2	10.0			
2030年	100.0	38.7	51.7	30.5	10.5	10.6	9.6			
2035年	100.0	39.7	51.1	29.9	10.0	11.2	9.2			

Note: The total does not necessarily match exactly with the sum of individual figures due to rounding.

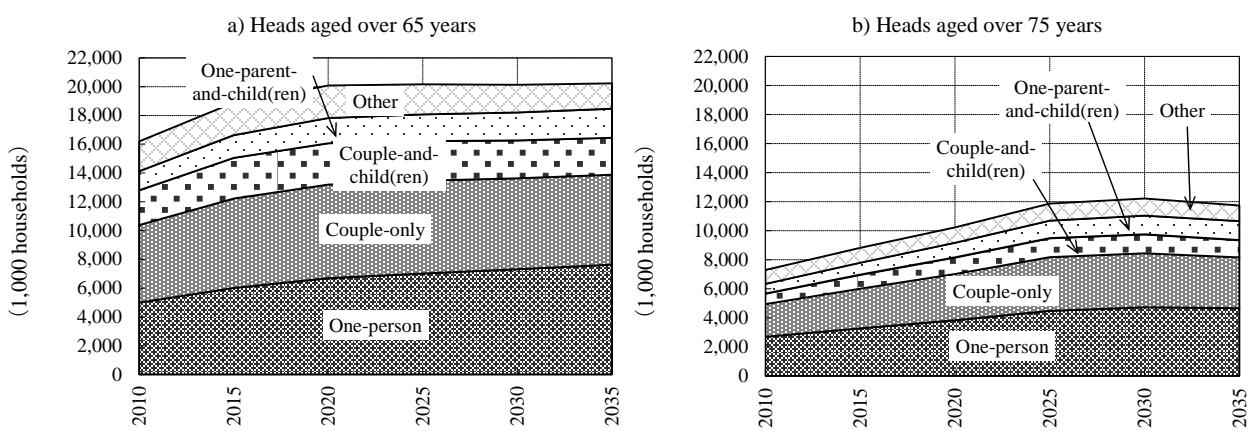

Figure 4. Development of Number of Households with Heads Aged over 65/75 Years by Family Type

Looking at the changes of percentages of households with heads aged over 65 years by family type, those showing consistent increase are “one-person households” and “one-parent-and-child(ren) households,” which increase from 30.7% to 37.7% and 8.2% to 10.0%, respectively. On the other hand, “couple-and-child(ren) households” and “other private households” steadily decline, from 33.3% to 30.9% and 12.8% to 8.7%, respectively. The percentage of “couple-only households” starts to decline after peaking out at 15.0% in 2015 and falls down to 12.7% in 2035.

For households with heads aged over 75 years, percentages of “one-person households” and “one-parent-and-child(ren) households” steadily increases from 36.8% to 39.7% and from 9.1% to 11.2%, respectively. The percentage of “other private households” steadily declines from 13.3% to 9.2%. The percentages of “couple-only households” and “couple-and-child(ren) households” first increase and then turn to decrease.

5. Comparison with Other Advanced Countries (Table 4)

Table 4 compares the characteristics of current and future households in Japan with current conditions of advanced countries. The mean size of households of Japan in 2010, 2.42 members, is at the same level as in the USA and Canada, and higher than the Northern/Western European countries. The percentage of one-person households in Japan is 32.4% in 2010, which is close to that of the USA. While Eastern Asian advanced economies show lower fertility than in Japan, they are still behind Japan in terms of family/household changes.

According to the present projections, the mean size of households in Japan is projected to drop to 2.20 by 2035. This is the average level in the Northern/Western European countries around 2010, almost the same as the size as in Norway, France and the Netherlands. Although the household size continues shrinking, it is not expected to go below the mean size of households of the current Denmark and Germany for the coming 25 years. The percentage of one-person households is projected to rise to be 37.2% in 2035, which is the average of Northern/Western Europe and lower than Norway, Denmark and the Netherlands today.

Table 4. International Comparison of Mean Size of Households and Percentage of One-person Households

Country	(Year)	Mean size of households (persons)	Percentage of one-person households (%)	Materials:
Norway	(2011)	2.2	39.7	Statistics Norway (http://www.ssb.no/familie_en/).
Denmark	(2012)	2.1	38.5	Statistics Denmark(http://www.dst.dk/HomeUK.aspx).
UK	(2010)	2.3	28.9	National Statistics, UK (http://www.ons.gov.uk/)
Germany	(2011)	2.0	40.4	Federal Statistical Office, FRG(http://www.statistik-portal.de/Statistik-Portal/en/)
Austria	(2010)	2.3	36.0	Statistik Austria (http://www.statistik.at/web_en/).
Netherlands	(2010)	2.2	36.1	Statistics Netherlands (http://www.cbs.nl/en-GB/default.htm).
France	(2009)	2.2	34.4	Institut national de la statistique et des études économiques (http://www.insee.fr/fr/)
USA	(2010)	2.6	32.9	U.S. Census Bureau (http://www.census.gov/).
Kanada	(2011)	2.5	27.6	Statistics Canada (http://www.statcan.gc.ca/start-debut-eng.html).
South Korea	(2010)	2.7	23.9	Statistics Korea (http://www.nso.go.kr/).
Taiwan	(2010)	2.9	28.8	Department of Statistics, Taiwan (http://www.moi.gov.tw/stat/index.aspx)
Japan	(2010)	2.42	32.4	
Japan	(2035)	2.20	37.2	

6. Comparison with Reference Projections (Table 5)

The reference projections estimate future changes of the number of households by keeping the distributions by combination of marital state and household position by sex and five-year age group constant at the values in 2010. The projections are based on the assumption that the household formation/dissolution behaviors do not change from 2005, which means that changes in the future are brought about only by the changes of population size and sex/age structures projected by the national population projection (medium fertility/ medium mortality variant).

According to Table 5, the number of households will continue to increase until around 2015 even if the household formation/dissolution behaviors do not change at all in the future, but the margin of increase is smaller than in the present projections. The change of household formation/dissolution behaviors increases the number of households in 2035 by 2% compared to the case where there is no change in the behaviors.

Table 5. Comparison between the Present Projections and Reference Projections

Year	Private households						
	Total	One-person	Family Nuclei				Other
			Total	Couple-only	Couple-and-child(ren)	One-parent-and-child(ren)	
2010	51,842	16,785	29,278	10,269	14,474	4,535	5,779
Present projections (1,000 households)							
2015	52,904	17,637	30,116	10,861	14,274	4,982	5,150
2020	53,053	18,270	30,189	11,037	13,814	5,338	4,594
2025	52,439	18,648	29,664	10,973	13,132	5,558	4,127
2030	51,231	18,718	28,770	10,782	12,340	5,648	3,743
2035	49,555	18,457	27,678	10,500	11,532	5,645	3,421
Reference projections (1,000 households)							
2015	52,151	16,698	29,577	10,664	14,307	4,606	5,876
2020	51,955	16,608	29,382	10,823	13,934	4,625	5,965
2025	51,223	16,402	28,799	10,820	13,414	4,564	6,023
2030	50,008	16,030	27,992	10,730	12,826	4,435	5,986
2035	48,394	15,470	27,098	10,599	12,229	4,269	5,826
Index (reference projections = 100)							
2015	101	106	102	102	100	108	88
2020	102	110	103	102	99	115	77
2025	102	114	103	101	98	122	69
2030	102	117	103	100	96	127	63
2035	102	119	102	99	94	132	59

Note: The total does not necessarily match exactly with the sum of individual figures due to rounding.

The change in future population size and sex/age structures work in the direction to decrease the number of “one-person households” from 16.78 million in 2010 to 15.47 million in 2035. This is because the population group in their 20s, many of whom are one-person households, decreases due to declining number of births, which has been progressing for more than 30 years. Thus, it can be concluded that the increase of “one-person households” in the present projections is mainly brought about by changes in marriage/household formation behaviors, such as tendencies of marrying later, not marrying at all, increased divorces, and decreasing numbers of parents and child(ren) living together.

The numbers of “couple-only households” and “one-parent-and-child(ren) households” increase for a while and then start to decrease in the reference projections. The long-term trends of changes coincide with the present projections. Thus, it is possible to understand that both factors of population structure and behavioral changes acting at the same time. However, the latter effect is dominant in “one-parent-and-child(ren) households.”

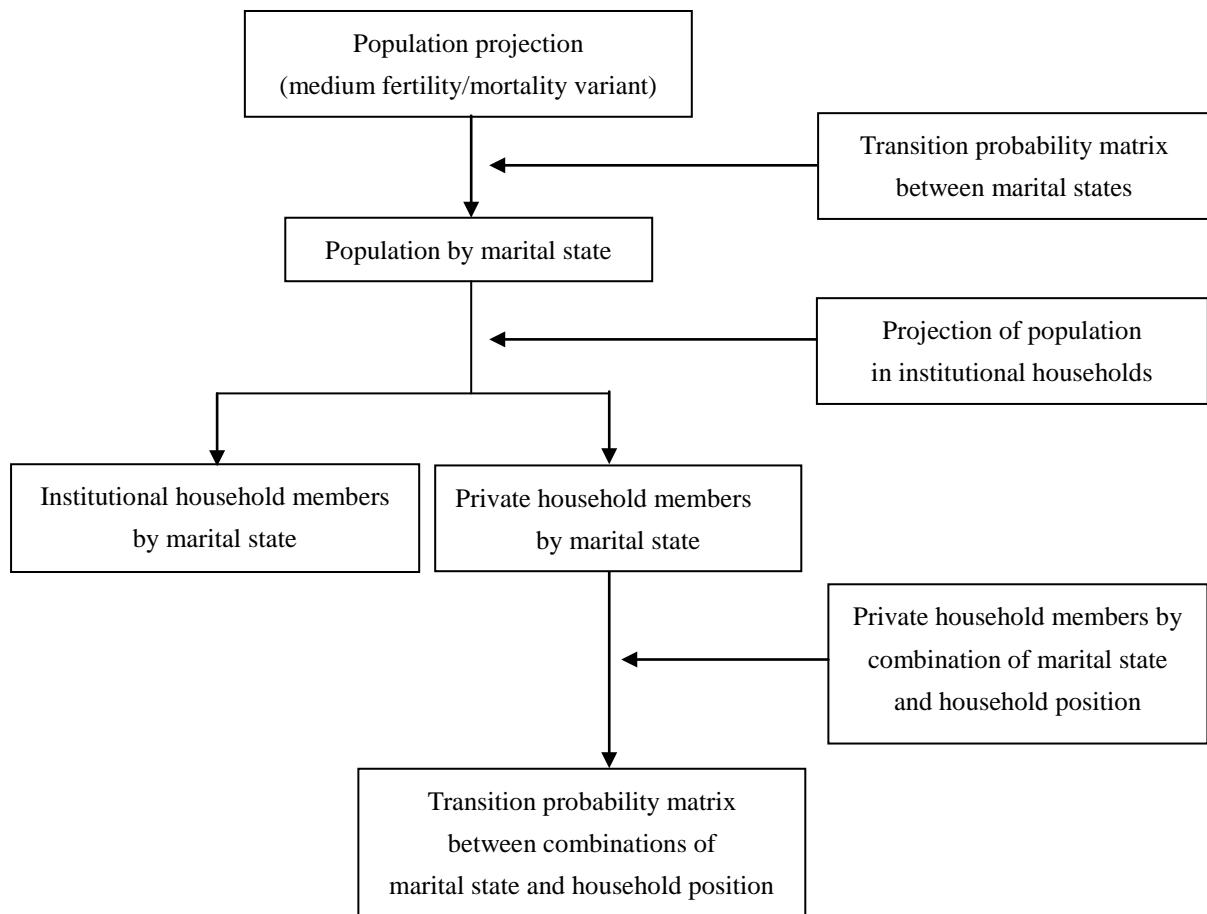

The number of "other private households" continuously increases until around 2025 in the reference projections in contrast to the result of the present projections. Thus, it is safe to say that the future decline of this family type is brought about mainly by the changes in behaviors, including changes in co-residing with parents or children.

III. Method of Projections

1. Outline of Projection Method

The computations involved in the projections were conducted according to the procedure shown in Figure 5. The essential part of the household projection was carried out by the household transition method, as in the previous projections. In this method, survivors are divided into several different states and the future population by state is projected by applying the transition probability matrix. Here, the states to be projected are combinations of marital state and household position.

Figure 5. Procedure of Household Projections

There is a strong correlation between household position and marital state in the Census. It is rare that single children living together with parents become heads or that wives living together with husbands become heads. If such exceptional combinations are left as is, not only does the transition probability matrix become unnecessarily large, but it also becomes impossible to obtain reliable transition probabilities from survey data. For this reason, we define markers as reference members of target households of the projection model and set the following rules to limit the combinations of marker's position, sex, and marital state, for the household heads of the Census and the Sixth National Survey on Household Changes (explained later).

- (1) Husbands are set as markers in couple-only households and couple-and-child(ren) households.
- (2) Parents are set as markers in one-parent-and- child(ren) households.

- (3) Husbands are set as markers in case wives living with their husbands are heads of other households.
(4) Fathers are set as markers in case single persons are heads of other households that include their parents.

As a result, we defined the following 12 and 11 types of combinations between marital state and household position, for male and female, respectively. Since it is very rare that married men are markers of “one-parent-and-child(ren) households,” this case is integrated with “one-person households” in the projection model and separated again after making the projections. The initial population in 2010 was obtained by converting the number of heads/non-heads of the Census by sex, five-year age group, and family type, into the corresponding numbers of markers/non-markers by sex, five-year age group, and family type.

Men			Women		
S:hS	Single	One-person household marker	S:hS	Single	One-person household marker
S:hO	Single	Other household marker *	S:hO	Single	Other household marker *
S:nh	Single	Non-marker	S:nh	Single	Non-marker
M:hS	Married	One-person household marker **	M:hS	Married	One-person household marker
M:hC	Married	Couple-only household marker	M:hP	Married	One-parent-and-child(ren) household marker
M:hN	Married	Couple-and-child(ren) household marker	M:sp	Married	Spouse
M:hO	Married	Other household marker	M:nh	Married	Other non-marker
M:nh	Married	Non-marker			
W:hS	Widowed or divorced	One-person household marker	W:hS	Widowed or divorced	One-person household marker
W:hP	Widowed or divorced	One-parent-and-child(ren) household marker	W:hP	Widowed or divorced	One-parent-and-child(ren) household marker
W:hO	Widowed or divorced	Other household marker	W:hO	Widowed or divorced	Other household marker
W:nh	Widowed or divorced	Non-marker	W:nh	Widowed or divorced	Non-marker

* Households not including parents

** Include parent-and-child(ren) household markers

Since the transition probability related to institutional household members cannot be obtained due to restrictions on data, we projected the percentage of institutional households by sex, five- year age group, and marital state by extrapolating the trends, as explained later. By applying this to the projected population by sex, five-year age group, and marital state, we obtained the number of private household members. On the other hand, we employed the transition probability matrix between the combinations of marital state and household position shown above to obtain the distribution , from which we obtained the population by marital state and household position (marker/non-marker), by sex and five-year age group. Based on the result at five-year intervals, we obtained the result for each year via linear interpolation. Moreover, we applied the conversion of the procedure at the time when the initial population of 2010 was created in reverse, to obtain the population by sex, five-year age group, marital state, and position within household.

2. Setting of Future Transition Probabilities among Marital States

We first created a tentative transition probability matrix among marital states, based on 2010 Census and the Vital Statistics of Japan. We applied this matrix to 2005 Census, adjusted various probabilities such that the distributions by sex, five-year age group, and marital state of the 2010 Census could be reproduced, and then created a transition probability matrix between marital states corresponding to the period 2005 – 2010. Using this matrix as the starting point, we created future transition probability matrices between marital states considering

changes of probabilities of first marriage, remarriage, divorce/bereavement, and death (five periods from the period 2010 – 2015 to the period 2030 – 2035).

The probabilities of first marriage and remarriage of women aged 15-49 were taken from the Population Projections in Japan (medium fertility/medium mortality variant). The probabilities of women aged 50 were obtained by applying trends in younger ages. The probabilities of men were adjusted such that they match the total number of marriages caused by the probabilities of women's first marriage and remarriage. The probability of death was adjusted such that it matches the probability of death in the future life table used in the Population Projection, while maintaining the relative risk by marital states. The probability of divorce/ bereavement is the weighted average of the probability of bereavement and probability of divorce. The probability of bereavement was reduced according to the reduction of the probability of death of the opposite sex in the future life table. We assumed that the probability of divorce would keep on increasing in the future as well because it increased in the period 2005–2010, but we assumed that the margin of increase would shrink linearly.

3. Projections of Percentage of Institutional Household Members

In the Sixth National Survey on Household Changes⁵⁾, the pattern of transition among household positions of private household members can be obtained, but data related to transition between private households and institutional households cannot be obtained. For this reason, we projected the percentage of future institutional household members by extrapolating the current trends. We smoothed out the rate of change of the percentage of institutional household members by sex, five-year age group, and marital state obtained from 2005 and 2010 Censuses and applied them until 2035.

4. Creation of Transition Probability Matrix

We obtained the transition probabilities among household positions from the marital transition matrix and the conditional transition patterns obtained from the Sixth National Survey on Household Changes. In this survey, household positions on the survey date as well as five years ago were asked. We performed conversions from heads/non-heads to markers/non-markers on this survey data according to the combinations of marital state and household position defined above. For example, if wives are household heads, they are replaced by husbands and if single children are household heads, they are replaced by parents, placing priority on fathers. We created a transition frequency matrix by sex and five-year age group, for household positions after the adjustment. We omitted very rare transitions to simplify the matrix. From this matrix, we obtained the conditional transition probability for each transition between marital states.

We then multiplied the transition probability among marital states by the thus obtained conditional transition probability to create the transition probability matrix between combinations of marital state and household position, by sex and five-year age group. We multiplied the vector of household positions obtained from the 2005 Census with this matrix and compared the result with the vector of household positions obtained from the 2010 Census, to adjust the transition probability. There was a change in definition of family type including a non-relative member in the 2010 Census. We relied on the retroactive tabulation of the 2005 Census provided by the Statistics Office so that the definition is constant between the 2005 and 2010 Censuses.

In the National Survey on Household Changes, it was observed that both men and women have been leaving their parents' households at an increasingly later age. For this reason, we assumed that the younger the cohort, the lower the transition probability from "single/non-marker" to "single/one-person household marker," for both men and women. It was assumed that the probability in 2030-35 is 95% of that in 2010-15 for age 15-19, 90% for age 20-24, 85% for age 25-29 and 80% for age 30 and older. Probabilities between 2015-20 and 2025-30 were interpolated geometrically.

5. Initial Population

The initial population, which is the benchmark of the projections, i.e., private household members by sex, five-year age group, and combination of marital state and household position (marker/non- marker) as well as institutional household members by sex, five-year age group, marital state, was obtained from the 2010 Census. The number of people with unknown age, marital sates and family type were distributed with iteration procedure. Private household members were obtained by converting heads/non-heads to markers/non-markers according to the aforementioned rules.

6. Projection Results

In the present projections, we first determined the future population by sex, five-year age group, and marital state. We obtained this figure as follows based on the distribution by sex, five-year age group, and marital state in the 2010 Census. We applied the prepared transition probability matrix among marital states to this base data sequentially to obtain the future distribution by marital state, and then multiplied the projected population by sex and five-year age group (medium fertility/ medium mortality) with this distribution. We then applied the prepared projections of the percentage of institutional households by sex, five-year age group, and marital state to this obtained future population to divide the population into private household members and institutional household members.

We started from the aforementioned initial population in 2010 and obtained the future distribution by combination of marital state and household position, by sequentially applying the transition probability matrix. We then multiplied private household members by sex, five-year age group, and marital state obtained above with the thus obtained distribution and obtained the future (five-year interval) population by combination of marital state and household position (marker/ non-marker). Based on this, we obtained the result for each year via linear interpolation, converted it from marker/non-marker to head/non-head, and finally obtained the number of household heads by sex, five-year age group, marital state, and family type. This number of household heads is the projected future number of households.

Notes:

- 1) This report is based on the material published on January 18, 2013.

- 4) “Other private households” consist of “other relatives households” and “households including non-relatives” in the family type categories of the Census. The latter accounts for as little as 7.9% in 2010. Note that approximately 70% of “other relative households” are three-generation households.
