第20回簡速静止人口表(生命表)

(昭和41年4月1日～42年3月31日)

THE 20TH ABRIDGED LIFE TABLES

(April 1, 1966 ~ March 31, 1967)

厚生省人口問題研究所

INSTITUTE OF POPULATION PROBLEMS
MINISTRY OF HEALTH AND WELFARE
Tokyo, Japan

序 文

急速に変転しつつあるわが国人口再生産力の動向あるいは総人口の大きさ、基本構造などの変化は、単に人口学的研究の重要な課題であるばかりでなく、現在から将来にかけて人口の変化に伴り諸問題を考究する上からも、精密な考察を不斷に推進すべき課題である。このような意義にかんがみて、本研究所においてもその基礎資料の一つとして昭和22年以後、各年簡速静止人口表を作製してきている。

この第20回簡速静止人口表も前回（第19回）の静止人口表に引き続き、昭和41年4月1日から昭和42年3月31日までの死亡に基づいて、前回までと同様の方法によつて作成したものである。

また、前回までの結果と比較して若干の解説を試みた。

今回の静止人口表の作成は資料課長厚生技官小林和正および同課厚生技官金子武治が担当した。

昭和42年11月1日

厚生省人口問題研究所長
館 総

FOREWORD

Japan has emerged as a country rapidly accomplishing a demographic transition. The drastic changes in fertility and mortality have brought about manifold effects upon the population size and composition and further upon the labor force, national economy and social life in Japan. There may be no other time than the present when systematic studies are most seriously needed for this turning phase of population dynamics toward the appropriate programming of our economy and social welfare.

As one of its major functions, the Institute of population problems, Ministry of Health and Welfare has long been carrying the tasks of providing basic informations concerning the changing shape of the demographic components of Japan. The construction of abridged life table is one of these assignments to supply with the up-to-date values of mortality probabilities the use of which many research situations call for. Abridged life tables were first produced by the Institute in 1947 and since then they have been published every year.

The present 20th Abridged Life Tables are constructed on the basis of the mortality statistics for April 1, 1966 March 31, 1967 by essentially the same methodology as in previous ones.

The present tables were prepared by Mr. Takeharu Kaneko of the Documentation Section under the supervision of Dr. Kazumasa Kobayashi, Chief of the Documentation Section of the Institute.

Minoru Tachi, Director

I 作成方法の概要

この第20回簡速静止人口表の作成の基本的方法は前回までと同様であるが、その概要を示せば、次のとおりである。

1 基礎人口

総理府統計局が推計した昭和41年10月1日現在の日本人人口。ただし85歳以上の各歳別人口については、前回の静止人口表の計算の基礎とした各歳別人口に前回の \bar{p}_x を適用して、各歳別人口の分布を求め、この結果を、上記の昭和41年10月現在 男女・年齢各歳別日本人人口のうち85歳以上人口男女別総数により補整して用いた。

2 死亡率の算定

前回と同様に、George King の Abridged Mortality Table の作成方法によつた。ただし、年齢15歳未満の若年齢と50歳以上の高年齢における死亡率については、次のように別途の方法によつている。

- (1) 15歳未満 q_x の第1近似値として前回の静止人口表の q_x を採用してある様の近似値によつて算定する。
- (2) 50歳以上 $x = 57, 62 \dots$ に対する q_x については、Gompertz-Makoham 曲線の適用が可能であると考えて、 $q_x = A + B e^{-C^x}$ から計算する。

前回と同様、各歳ごとの数値を補間して算出しこれを掲げ、また、年齢別人口推計の便宜のため、満 x 歳人口が翌年満 $(x+1)$ 歳人口になる確率、すなわち生年別生存率 \bar{p}_x および生年別死亡率 \bar{q}_x もあわせて掲げてある。

The 20th Abridged Life Tables Methodological Note

The method of constructing the 20th Abridged Life Tables is fundamentally the same as of the life tables issued previously by the Institute of Population Problems, Ministry of Health and Welfare. Its outline is briefly described below.

1. The base population by sex and age for October 1, 1966.

The population estimates for October 1, 1966 given by the Bureau of Statistics, Prime Minister's Office was used for the base population up to 85 years of age.

Since these estimates do not indicate five-year age breakdowns of the population beyond 85, that part of the population by five-year group is estimated by the Institute of Population Problems by use of the survival ratios obtained from the life tables previously published.

2. Life table mortality rate

The methodology of constructing the present life table is mainly of George King's abridged mortality tables. Some modifications are applied, however, to the ages under 15 and to the ages 50 years and over.

a) Under 15 years. The life table mortality rates (${}_nq_x$) for the ages 15 are adjusted to the corresponding rates in the preceding life tables published by the Institute of Population Problems.

b) 50 years and over. The life table mortality rates for the ages 50 years and over are modified by using the Gompertz-Makeham curve: $q_x = A + BCx$

As in the life tables previously published by the Institute, also shown in these life tables are the single year values of each life table including survival ratios (\bar{p}_x) and their obverse (\bar{q}_x).

静止人口表（生命表）における記号の名称と定義

Definitions and Notation of Life Table Function in the Present Life Tables

| 記号 Notation | 名 称 Designation | 定義 Actuarial Definition |
|------------------------|----------------------------------------------------------------------------------------------------------|---------------------------------------|
| $n L_x$ | x 歳の生存年数(静止人口) Life years survived in the age interval in stationary population | $\int_x^{x+n} \ell_x d_x$ |
| T_x | x 歳以後の生存延べ年数(静止人口の合計) Life years survived in this and all subsequent years in stationary population | $\int_x^w \ell_x d_x$ |
| ℓ_x | x 歳の生存数 Survivors of 100,000 born alive at beginning of age interval | $100000 \times \prod_{x=0}^{x-n} p_x$ |
| $n d_x$ | x 歳の死亡数 Number dying of 100,000 born alive during age interval | $\ell_x - \ell_{x+n}$ |
| $n p_x$ | x 歳の生存率 Probability of surviving at beginning of age interval | $\frac{\ell_{x+n}}{\ell_x}$ |
| $n q_x$ | x 歳の死亡率 Probability of dying at beginning of age interval | $\frac{n d_x}{\ell_x}$ |
| $\overset{\circ}{e}_x$ | x 歳の完全平均余命 Average remaining life time at beginning of age interval | $\frac{T_x}{\ell_x}$ |
| $n \bar{p}_x$ | 満 x 歳人口の生年別生存率 Survival ratio in stationary population | $\frac{n L_{x+n}}{n L_x}$ |
| \bar{q}_x | 満 x 歳人口の生年別死亡率 Probability of dying in stationary population | $\frac{n L_x - n L_{x+n}}{n L_x}$ |

第4表(つづき) Table 4 (Continued)

(2)と(5)は、厚生省大臣官房統計調査部の資料によるもので、昭和38～40年の各年の確定数と概数の比を年齢階級別にとり、3か年の平均を昭和41年の概数に乗じて推定確定数を算出。つぎに、この推定確定数に昭和40年の届け漏れ率を乗じて補正し、推定死亡数としたもの。小数点以下4捨5入のため個々の数字の総和が必ずしも総数に一致しない。

(3)と(6)の年齢別人口は、総理府統計局推計、昭和41年10月1日人口。

(4)と(7)は、(3)と(6)の人口に、(2)と(5)の死亡数の2分の1を加えたもの。

Columns (2) and (5): The figures listed in these columns are based on the statistics preliminarily reported by the Division of Health and Welfare Statistics, Secretariat of Minister of Health and Welfare. These preliminary death statistics are inflated somewhat by multiplying them by the age-specific correction factors which are the three-year average ratios of the corrected estimates of deaths to those preliminarily reported for the years 1963-1965. The numbers of deaths thus estimated are further modified to eradicate understatements by applying the adjustment factors obtained from the vital statistics of 1965.

Columns (3) and (6): The population figures by age here are those of the population estimates for October 1, 1966 given by the Bureau of Statistics, Prime Minister's Office.

Columns (4) and (7): (4)=(3)+ $\frac{(2)}{2}$, (7)=(6)+ $\frac{(5)}{2}$.

■ 結果の説明

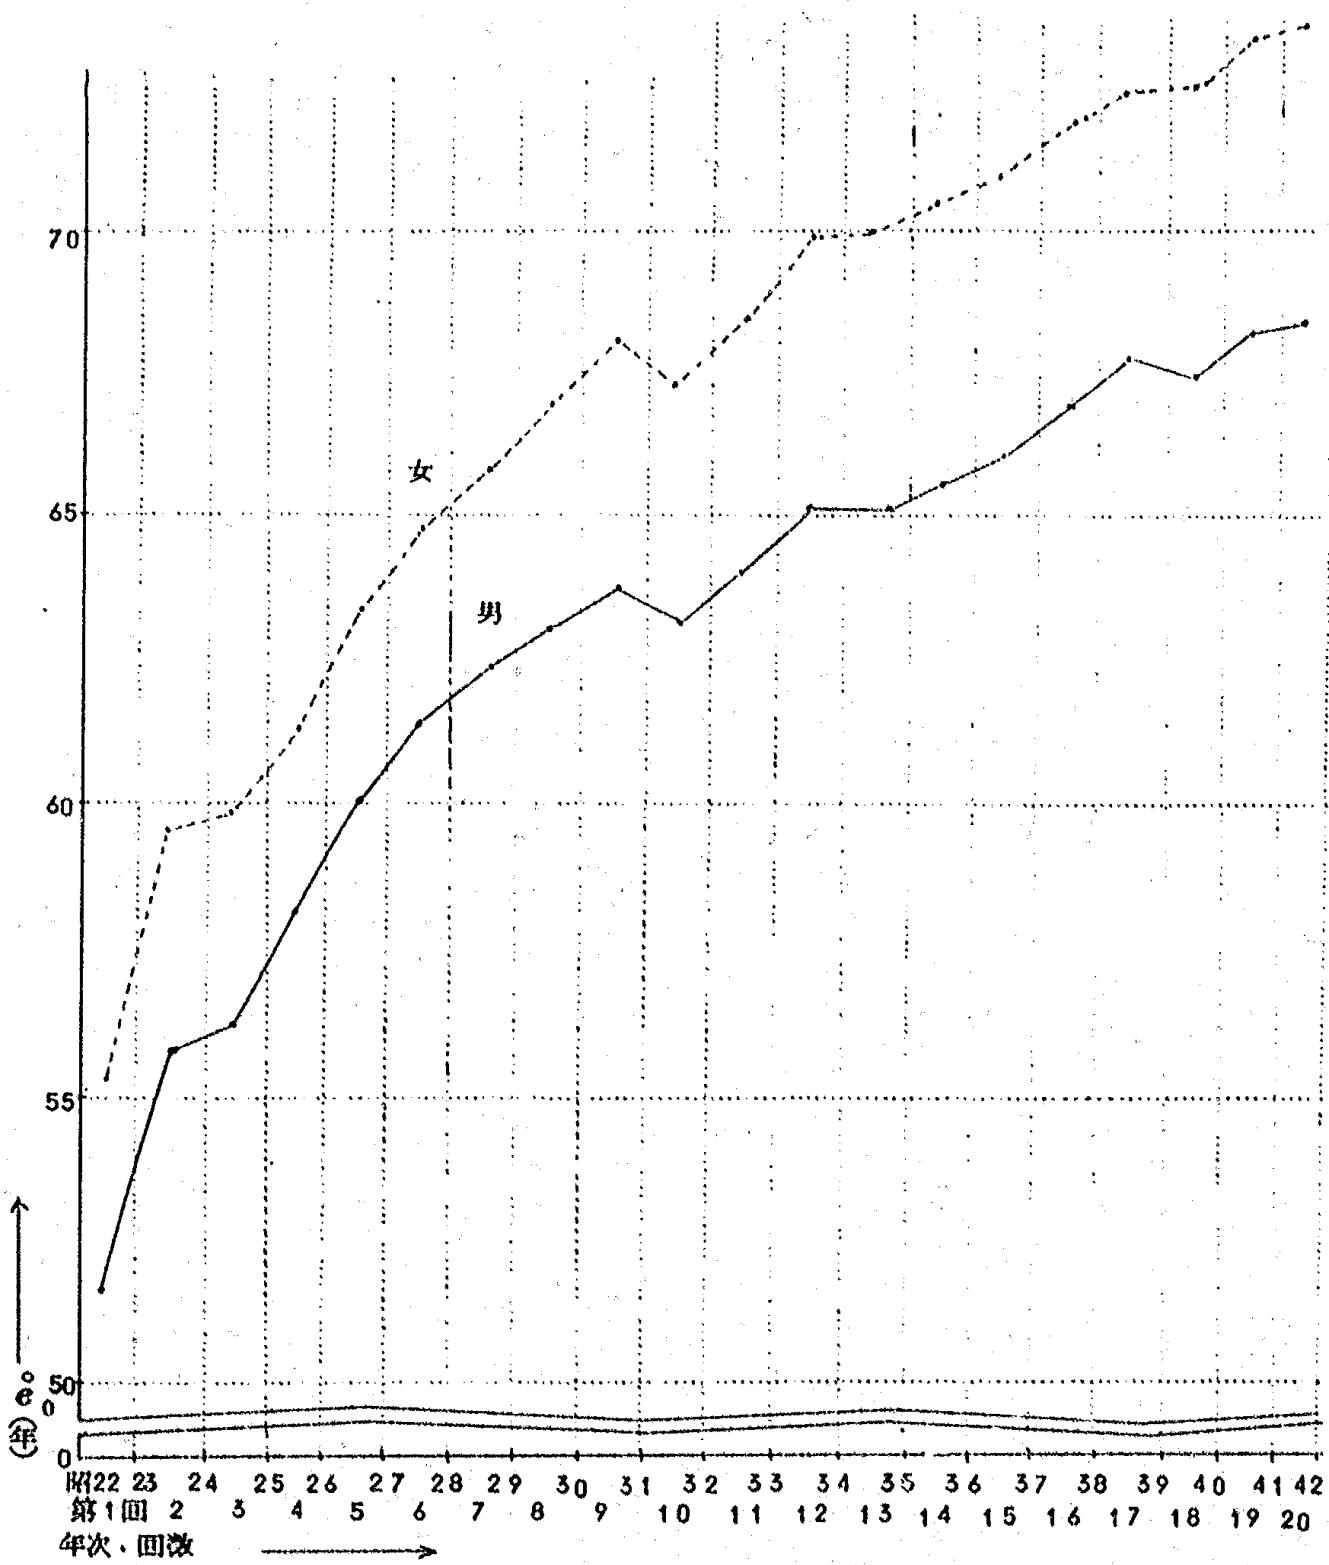

第20回簡速静止人口表によれば0歳の平均余命(\bar{e}_0)は男子68.29年、女子73.46年で、この値は前回(第19回：男子68.09年、女子73.30年)と比較して、男子では0.20年、女子では0.16年増加した。この伸びは第18回から第19回へかけてのよりも少なくなっている。これはとくに高齢における死亡率が前回よりも上昇しているためである。年齢別に平均余命(\bar{e}_x)を前回と比較してみても、男子では61歳以上、女子では73歳以上において若干低下している。

年齢階級別に死亡率(${}_5q_x$)を前回と比較すると、男子では10～24歳および70歳以上において、女子では15～24歳および80歳以上において上昇し、その他の年齢階級では男女とも低下している。
