

Household Projections for Japan 2015-2040 ¹⁾

Outline of Results and Methods

Introduction

“Household Projections for Japan (Outline of Results and Methods)” projected the number of households nationwide and was released in 2018. The initial population used as the benchmark of the projections was obtained by adjusting the results of the 2015 Census.

I. Framework of Projections

1. Period of Projections

The period for the present projections is the twenty-five years from October 1, 2015 to October 1, 2040.

2. Method and Results of Projections

The essential part of the household projections was carried out by the household transition method. This method projects distributions by combination of future marital states and household positions, by setting transition probabilities of members private households, and applies them to the population by sex and five-year age group of “Population Projections for Japan (Published in 2017)” ²⁾ (medium fertility/medium mortality variant) in order to project the population by sex, five-year age group, and combination of marital state and household positions. Households are identified with markers such as “one-person households,” “couple-only households,” “couple-and-child(ren) households,” “one-parent-and-child(ren) households,” and “other households.” Markers refer to members regarded as key persons in terms of household formation/dissolution in projection models and usually match with the household heads of the Census. For exceptional cases such as a wife or a child becoming the head of “couple-and-child(ren) households,” we set certain rules such as the marker of “couple-and-child(ren) households” always being the husband and the marker of “one-parent-and-child(ren) households” always being the parent. We applied the correspondence between head/non-head and marker/non-marker in 2015 to the projected population by sex, by five-year age group, and by marital state and household positions (marker/ non-marker) to obtain the number of heads by sex, five-year age group, marital state, and family type.

The detailed results of the projections are shown in Result Table 1 (Number of Private Households by Family Type, Mean Household Members, Mean Size of Households) and Result Table 2 (Number and Percentages of Private Households by Head's Sex and Five-year Age Group, by Family Type).

3. Initial Population

We obtained the initial population used as the benchmark of the projections based on the 2015 Census, by converting positions of members within private households from heads/non-heads by family type to markers/non-markers by family type.

4. Variants of Projections

The present projections handle only one case. Additionally, for reference, we also calculated the number of households under the assumption that the distributions by sex, five-year age group, and combination of marital state and household positions remain constant from 2015 and onward.

The purpose of the projections is to obtain a future number of private households by family type. This report deals with five different family types: “one-person households,” “couple-only households,” “couple-and-child(ren) households,” “one-parent-and-child(ren) households,” and “other households.”³⁾ (Table 1)

Table 1. Family Types in Present Projection and Census

Present Projection		2010 Census of Japan			Number of households ¹⁾		
Private households	Family nuclei	One-person households	Private households	One-person households		18,418	
		Couple-only		Family nuclei	A married couple only	10,718	
		Couple-and-child(ren)			A married couple with their child(ren)	14,288	
		One-parent-and-child(ren)			Father with his child(ren)	703	
	Other private households				Other relatives households	Mother with her child(ren)	4,045
						A couple with their parents	191
						A couple with their parent	676
						A couple with their child(ren) and parents	710
						A couple with their child(ren) and parent	1,214
						A couple with their relative(s) other than child(ren) and parent(s)	113
						A couple with their child(ren) and relative(s) other than parent(s)	410
						A couple with their parent(s) and relative(s) other than child(ren)	86
						A couple with their child(ren), parent(s) and relative(s)	273
						Brothers and sisters only	323
						Other relatives households not elsewhere classified	565
						Households including non-relatives	464
						Institutional households	
Inpatients in hospitals	11						
Inmates of social institutions	61						
Persons in camps of Self-Defence Forces	3						
Inmates of reformatory institutions	1						
Others	36						

1) In 1,000 households reported in the 2015 Census of Japan.

Households that family type is unknown (85,798 households) are not included.

II. Overview of Projection Results

1. Number of Private Household Members and Total Number of Private Households (Figure 1)

The total population of Japan has started declining from around 2010. According to the present household projections, the development of the number of private household members shows generally the same trends as the total population. As seen in Result Table 1, the number of private household members decreases year by year from 124.3 million people in 2015 to 157.0 million in 2040, which is a reduction of 18.6 million people.

On the other hand, the total number of private households, as shown in Figure 1, continues to grow from 53.33 million in 2015 to peak out at 54.19 million households in 2023. Afterward, however, the number starts to decrease and the total number of private households in 2040 is 50.76 million, which is smaller by 2.57 million than in 2015.

2. Mean Size of Households (Figure 2)

The fact that the number of households continues to increase even under the population decline implies that the household size keeps on shrinking. The mean size of private households will continue to decrease, from 2.33 members in 2015 to 2.08 in 2040.

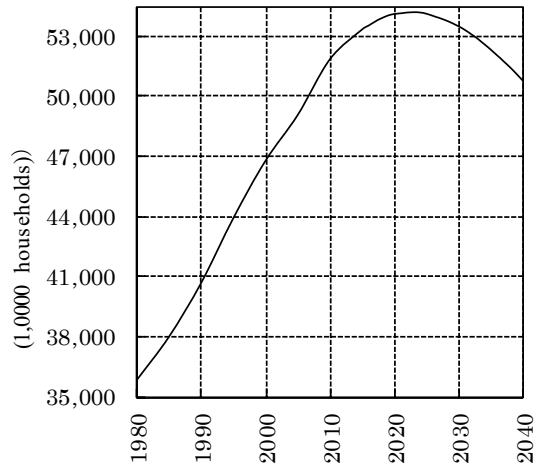

Figure 1. Total Number of Private Households

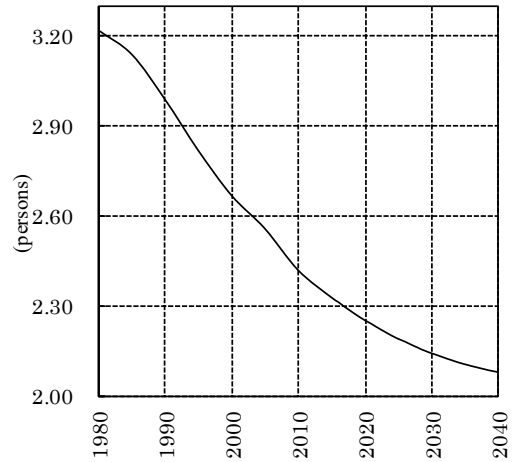

Figure 2. Mean Size of Private Households

Table 2. Number and Percentage of Private Households by Family Type

Year	Private households						
	Total	One-person	Family Nuclei				Other
			Total	Couple-only	Couple-and-child(ren)	One-parent-and-child(ren)	
Number of households (1,000)							
1980	35,824	7,105	21,594	4,460	15,081	2,053	7,124
1985	37,980	7,895	22,804	5,212	15,189	2,403	7,282
1990	40,670	9,390	24,218	6,294	15,172	2,753	7,063
1995	43,900	11,239	25,760	7,619	15,032	3,108	6,901
2000	46,782	12,911	27,332	8,835	14,919	3,578	6,539
2005	49,063	14,457	28,394	9,637	14,646	4,112	6,212
2010	51,842	16,785	29,207	10,244	14,440	4,523	5,765
2015	53,332	18,418	29,870	10,758	14,342	4,770	5,044
2020	54,107	19,342	30,254	11,101	14,134	5,020	4,510
2025	54,116	19,960	30,034	11,203	13,693	5,137	4,123
2030	53,484	20,254	29,397	11,138	13,118	5,141	3,833
2035	52,315	20,233	28,499	10,960	12,465	5,074	3,583
2040	50,757	19,944	27,463	10,715	11,824	4,924	3,350
Percentage (%)							
1980	100.0	19.8	60.3	12.5	42.1	5.7	19.9
1985	100.0	20.8	60.0	13.7	40.0	6.3	19.2
1990	100.0	23.1	59.5	15.5	37.3	6.8	17.4
1995	100.0	25.6	58.7	17.4	34.2	7.1	15.7
2000	100.0	27.6	58.4	18.9	31.9	7.6	14.0
2005	100.0	29.5	57.9	19.6	29.9	8.4	12.7
2010	99.8	32.4	56.3	19.8	27.9	8.7	11.1
2015	100.0	34.5	56.0	20.2	26.9	8.9	9.5
2020	100.0	35.7	55.9	20.5	26.1	9.3	8.3
2025	100.0	36.9	55.5	20.7	25.3	9.5	7.6
2030	100.0	37.9	55.0	20.8	24.5	9.6	7.2
2035	100.0	38.7	54.5	21.0	23.8	9.7	6.8
2040	100.0	39.3	54.1	21.1	23.3	9.7	6.6

Note: The total does not necessarily match exactly with the sum of individual figures due to rounding.

The number of households which family type was unknown in the 2015 census was proportionally distributed.

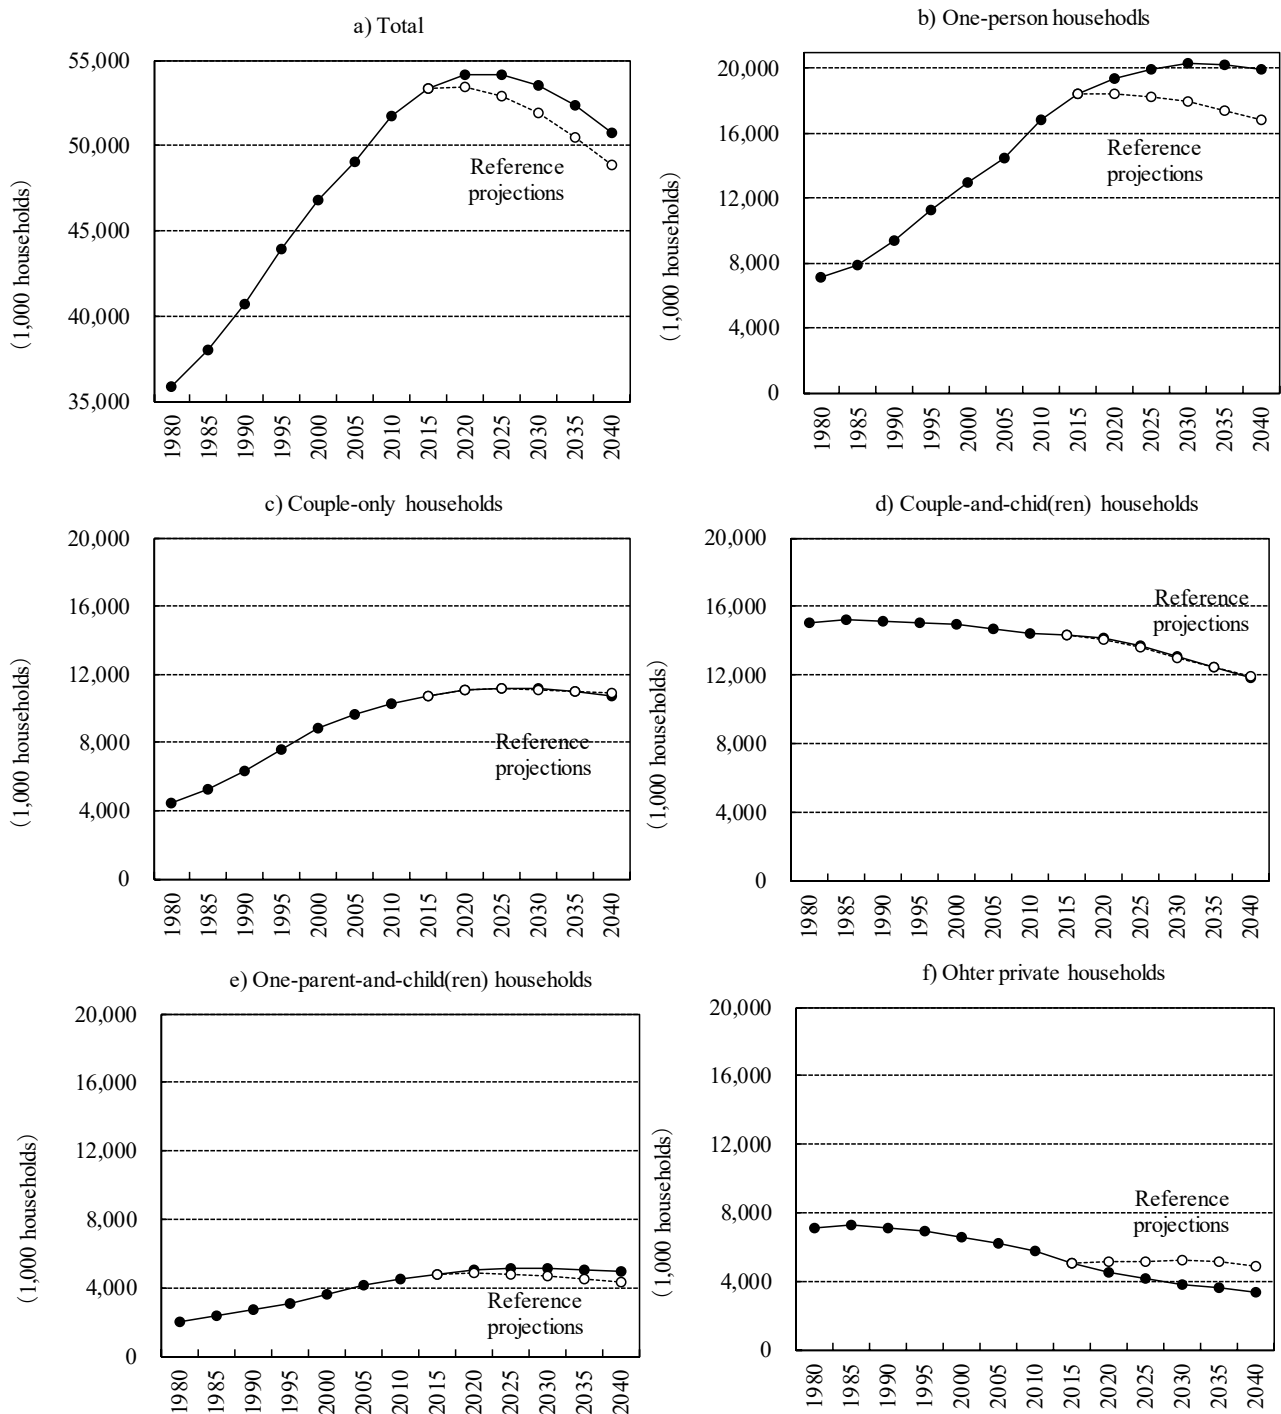

The total number of households in the 2010 census includes households of which family type was unknown.

The percentage by family type in the 2010 census was calculated with the denominator excluding the number of households of which family type was unknown.

3. Number and Percentage of Private Households by Family Type (Table 2, Figure 3)

As shown in Table 2 and Figure 3, the number of “couple-and-child(ren) households” and “other private households” continues to decrease from 2015. The number of “one-person households”, “couple-only households” and “one-parent-and-child(ren) households” will continue to grow for several decades but eventually starts declining in the 2030s.

Figure 3. Number of Private Households by Family Type

The number of “one-person households” keeps on increasing from 18.42 million in 2015 and peaks out in 2032. The number in 2040 is projected to be 19.94 million, which is 1.53 million larger than 2015. Its percentage out of the total number of private households also increases from 34.5% in 2015 to 39.3% in 2040, an increase of 4.8 percent points.

The number of “couple-only households” increases for the foreseeable future, but the rate of increase is not as rapid as for “one-person households.” Moreover, the number starts to decline after 2025. That is, after increasing from 10.76 million in 2015 to 11.20 million in 2025, the number starts to decline and reaches 10.71 million in 2040. However, the percentage out of the total number of private households increases from 20.2% to 21.1% in 2040.

The number of “couple-and-child(ren) households” has been declining after 1985, and this trend accelerates in the future: the number decreases from 14.34 million to 11.82 million from 2015 to 2040. This “couple-and-child(ren) household” type used to be the most common family type, accounting for 40% or more of private households, but since then the percentage has already declined significantly to 26.9% in 2015, and is projected to decrease further to 23.3% in 2040.

The number of “one-parent-and-child(ren) households” grows from 4.77 million in 2015 to 5.15 million in 2029 and then will decline. The percentage accounted for by this family type changes from 8.9% to 9.7% between 2015 and 2040.

The majority of “other households” are stem-families which consist of a family nuclei and direct ancestors or descendants. This family type, in the same way as for “couple-and-child(ren) households,” started to decline in the second half of the 1980s. The downward trend continues in the future as well and the number decreases from 5.15 million to 4.92 million from 2010 to 2040. The percentage it accounts for also declines, from 8.9% in 2015 to 6.6% in 2040.

4. Households with Elderly Heads (Table 3)

1) Total Number of Households with Elderly Heads

As shown in Table 3, the total number of private households with heads aged over 65 years increases from 19.18 million in 2015 to 22.42 million in 2040. Households with heads aged over 75 years also increases from 8.88 million to 12.17 million from 2010 to 2040.

Because the growth rate of the number of households with heads aged over 65 years is higher than that of the total number of private households, the percentage of the households with heads aged over 65 years increases dramatically from 36.0% to 44.2% from 2015 to 2040. Moreover, the percentage of households with heads aged over 75 years out of households with heads aged over 65 years also increases, from 46.3% in 2015 to 54.3% in 2040.

2) Number of Households with Elderly Heads by Family Type

When the values of 2015 and 2040 are compared in terms of number of households with heads aged over 65 years by family type, “one-person households” shows the highest growth rate of a factor of 1.43 (an increase from 6.25 million to 8.96 million), followed by “one-parent-and-child(ren) households” with a factor of 1.19 (an increase from 1.66 million to 1.98 million). While the number of “couple-only” and “couple-and-child(ren)” households increases slightly, the number of “other private households” will decrease from 2.13 million to 1.71 million.

As for the number of households with heads aged over 75 years, all family types show greater growth compared to households with heads aged over 65 years. For example, “one-person households” grows with a factor of 1.52 (an increase from 3.37 million to 5.12 million) and “one-parent-and childr(en) households with a factor of 1.40 (from 0.87 million to 1.22 million).

Table 3. Number and Percentage of Households with Heads Aged Over 65/75 Years by Family Type

Year	Private households						
	Total	One-person	Family Nuclei				Other
			Total	Couple-only	Couple-and-child(ren)	One-parent-and-child(ren)	
Number of households (1,000)							
Head aged over 65 years							
2015	19,179	6,253	10,800	6,277	2,862	1,661	2,126
2020	20,645	7,025	11,551	6,740	2,990	1,821	2,069
2025	21,031	7,512	11,582	6,763	2,915	1,904	1,937
2030	21,257	7,959	11,483	6,693	2,842	1,948	1,816
2035	21,593	8,418	11,449	6,666	2,811	1,972	1,727
2040	22,423	8,963	11,752	6,870	2,906	1,976	1,708
Head aged over 75 years (re-insertion)							
2015	8,883	3,369	4,575	2,735	970	870	939
2020	10,424	3,958	5,521	3,279	1,202	1,039	945
2025	12,247	4,700	6,519	3,881	1,435	1,203	1,029
2030	12,763	5,045	6,693	3,976	1,454	1,264	1,025
2035	12,403	5,075	6,371	3,762	1,356	1,253	957
2040	12,171	5,122	6,153	3,635	1,299	1,220	896
Percentage (%)							
Head aged over 65 years							
2015	100.0	32.6	56.3	32.7	14.9	8.7	11.1
2020	100.0	34.0	56.0	32.6	14.5	8.8	10.0
2025	100.0	35.7	55.1	32.2	13.9	9.1	9.2
2030	100.0	37.4	54.0	31.5	13.4	9.2	8.5
2035	100.0	39.0	53.0	30.9	13.0	9.1	8.0
2040	100.0	40.0	52.4	30.6	13.0	8.8	7.6
Head aged over 75 years (re-insertion)							
2015	100.0	37.9	51.5	30.8	10.9	9.8	10.6
2020	100.0	38.0	53.0	31.5	11.5	10.0	9.1
2025	100.0	38.4	53.2	31.7	11.7	9.8	8.4
2030	100.0	39.5	52.4	31.2	11.4	9.9	8.0
2035	100.0	40.9	51.4	30.3	10.9	10.1	7.7
2040	100.0	42.1	50.6	29.9	10.7	10.0	7.4

Note: The total does not necessarily match exactly with the sum of individual figures due to rounding.

Looking at the changes of percentages of households with heads aged over 65 years by family type, those showing consistent increase is “one-person households” which increase from 32.6% to 40.0% and 8.7% to 9.2%, respectively. “One-parent-and-child(ren)” household increase from 8.7% to 9.2% from 2015 to 2030, then decline to 8.8% in 2040. The percentages of other three types consistently decreases.

For households with heads aged over 75 years, the percentage of “one-person households” steadily increases from 37.9% to 42.1%. The percentage of “other private households” steadily declines from 10.6% to 7.4%. Percentages of other three types of households will fluctuate and the values in 2040 will not be significantly different from 2015.

5. Comparison with Other Advanced Countries (Table 4)

Table 4 compares the characteristics of current and future households in Japan with current conditions of advanced countries or regions. The mean size of households of Japan in 2015, 2.33 members, is close to the UK and Canada, and higher than other Northern/Western European countries. The percentage of one-person households in Japan is 34.5% in 2015, which is also lower than Northern/Western European countries other than the UK. While Eastern Asian advanced economies show lower fertility than in Japan, they are still behind Japan in terms of family/household changes.

According to the present projections, the mean size of households in Japan is projected to drop to 2.08 by 2040. This is still larger than Denmark and Germany in 2016. The percentage of one-person households is projected to rise to be 39.3% in 2040, which is again still lower than Norway and Germany today.

Table 4. International Comparison of Mean Size of Households and Percentage of One-person Households

Country, Region	(Year)	Mean size of households (persons)	Percentage of one-person households (%)
Norway	(2015)	2.2	38.4
Denmark	(2016)	2.0	44.8
UK	(2016)	2.3	29.7
Germany	(2016)	2.0	40.7
Austria	(2016)	2.2	37.0
Netherlands	(2016)	2.2	37.6
France	(2016)	2.2	35.5
USA	(2016)	2.7	28.0
Canada	(2016)	2.4	28.2
South Korea	(2015)	2.5	27.2
Taiwan	(2015)	2.8	31.6
Japan	(2015)	2.33	34.5
Japan	(2040)	2.08	39.3

6. Comparison with Reference Projections (Table 5)

The reference projections estimate future changes of the number of households by keeping the distributions, by combination of marital state and household position, by sex and five-year age group constant at the values in 2015. The projections are based on the assumption that the household formation/dissolution behaviors do not change from 2015, which means that changes in the future are brought about only by the changes of population size and sex/age structures projected by the national population projection (medium fertility/ medium mortality variant).

According to Table 5, the number of households will continue to increase until around 2020 even if the household formation/dissolution behaviors do not change at all in the future, but the margin of increase is smaller than in the present projections. The change of household formation/dissolution behaviors increases the number of households in 2040 by 4% compared to the case where there is no change in the behaviors.

The change in future population size and sex/age structures work in the direction to decrease the number of “one-person households” from 18.42 million in 2015 to 16.81 million in 2040. This is because the population group in their 20s, many of whom are one-person households, decreases due to fertility decline, which has been progressing for several decades. Thus, it can be concluded that the increase of “one-person households” in the present projections is mainly brought about by changes in marriage/household formation behaviors, such as tendencies of marrying later, not marrying at all, increased divorces, and decreasing numbers of parents and child(ren) living together.

Table 5. Comparison between the Present Projections and Reference Projections

Year	Private households						
	Total	One-person	Family Nuclei				Other
			Total	Couple-only	Couple-and-child(ren)	One-parent-and-child(ren)	
2015	53,332	18,418	29,870	10,758	14,342	4,770	5,044
Present projections (1,000 households)							
2020	54,107	19,342	30,254	11,101	14,134	5,020	4,510
2025	54,116	19,960	30,034	11,203	13,693	5,137	4,123
2030	53,484	20,254	29,397	11,138	13,118	5,141	3,833
2035	52,315	20,233	28,499	10,960	12,465	5,074	3,583
2040	50,757	19,944	27,463	10,715	11,824	4,924	3,350
Reference projections (1,000 households)							
2020	53,408	18,407	29,894	11,032	14,037	4,825	5,108
2025	52,930	18,260	29,503	11,123	13,576	4,805	5,167
2030	51,907	17,926	28,802	11,085	13,021	4,696	5,179
2035	50,427	17,401	27,936	10,968	12,439	4,530	5,090
2040	48,826	16,810	27,106	10,857	11,895	4,353	4,910
Index (reference projections = 100)							
2020	101.3	105.1	101.2	100.6	100.7	104.0	88.3
2025	102.2	109.3	101.8	100.7	100.9	106.9	79.8
2030	103.0	113.0	102.1	100.5	100.7	109.5	74.0
2035	103.8	116.4	102.0	99.9	100.2	112.0	70.4
2040	104.0	118.6	101.3	98.7	99.4	113.1	68.2

Note: The total does not necessarily match exactly with the sum of individual figures due to rounding.

The numbers of “couple-only households” and “one-parent-and-child(ren) households” increase for a while and then start to decrease in the reference projections. The long-term trends of changes coincide with the present projections. Thus, it is possible to understand that both factors of population structure and behavioral changes acting at the same time.

The number of "other private households" continuously increases until around 2030 in the reference projections in contrast to the result of the present projections. Thus, it is safe to say that the future decline of this family type is brought about mainly by the changes in behaviors, including changes in co-residing of parents and children.

6. Percentage of Single Men and Women (Table 6)

As described in the later section, the projection of marital states was conducted in advance of that of household positions. Marital states were divided into “single”, “currently married”, and “widowed or divorced”. It is expected that the percentage of single will rise while that of currently married will decline due to the long-term tendency of less and later marriage. While the rise in divorce rate in past decades may raise the percentage of widowed or divorced in young and middle ages, mortality decline may reduce the transition probability to widowhood. This section gives a general view in the percentage of single. Detailed figures of all marital states can be found in the Result Table 4.

Table 6 shows that changes in the percentage of single men and women are expected to be small for ages under 50. However, the percentage of single will rise sharply for old ages. This is because the present old people that married when universal marriage was the norm are replaced by younger cohorts that suffered from nuptiality decline since the late 1970s. Consequently, the percentage of single elderly of age 65 and older will rise from 5.9% to 14.9% between 2015 and 2040 for men, and from 4.5% to 9.9% for women. The percentage for 75 years and older also will rise from 2.6% to 10.2% for men, and from 3.9% to 6.5% for women.

7. Percentage of Living Alone (Table 7)

As already described, the percentage of one-person household out of the total number of households was projected to increase from 34.5% in 2015 to 39.3% in 2040. Because the number of one-person households is equivalent with the number of persons living alone, this percentage gives the propensity to live alone among all private household heads. However, one may be interested in the percentage of living alone among all persons including non-heads and institutionalized people. Table 7 gives such percentages by sex and age group.

The trend of the propensity to live alone is affected by that of single persons. Changes in the percentage of living alone are expected to be small in younger ages because the percentage of single does not increase significantly. On the other hand, the percentage of men living alone rises from 14.0% in 2015 to 20.8% in 2040 for 65 years and older, and from 12.8% in 2015 to 18.4% in 2040 for 75 years and older. While the percentage of women living alone is expected to rise from 21.8% in 2015 to 24.5% in 2040, the change is small if only women aged 75 and older are considered. This is because the change in percentage of single is assumed to be small for women in this age group, and such a change may be offset by the increase in currently married due to mortality decline.

Table 7. Projected Percentage of Living Alone

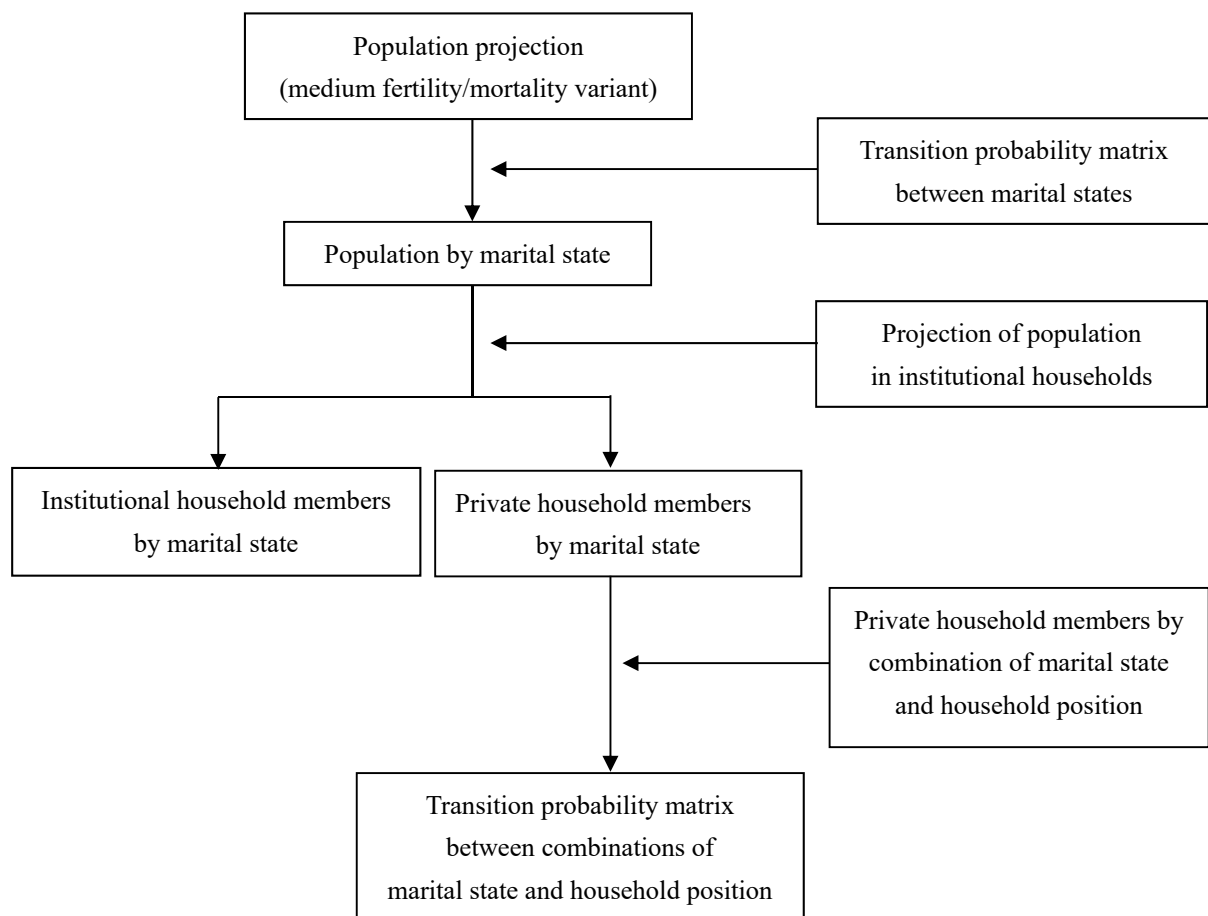

Male	2015	2020	2025	2030	2035	2040
15—19	7.1	7.0	7.0	7.0	7.0	7.0

III. Method of Projections

1. Outline of Projection Method

The computations involved in the projections were conducted according to the procedure shown in Figure 4. The essential part of the household projection was carried out by the household transition method. In this method, survivors are divided into several different states and the future population by state is projected by applying the transition probability matrix. Here, the states to be projected are combinations of marital state and household position.

Figure 4. Procedure of Household Projections

There is a strong correlation between household position and marital state in the Census. It is rare that single children living together with parents become heads or that wives living together with husbands become heads. If such exceptional combinations are left as is, not only does the transition probability matrix become unnecessarily large, but it also becomes impossible to obtain reliable transition probabilities from survey data. For this reason, we define markers as reference members of target households of the projection model and set the following rules to limit the combinations of marker's position, sex, and marital state, for the household heads of the Census and the Seventh National Survey on Household Changes (explained later).

- (1) Husbands are set as markers in couple-only households and couple-and-child(ren) households.
- (2) Parents are set as markers in one-parent-and- child(ren) households.
- (3) Husbands are set as markers in case wives living with their husbands are heads of other households.

(4) Fathers are set as markers in case single persons are heads of other households that include their parents.

As a result, we defined the following 12 and 11 types of combinations between marital state and household position, for male and female, respectively. Since it is very rare that married men are markers of “one-parent-and-child(ren) households,” this case is integrated with “one-person households” in the projection model and separated again after making the projections. The initial population in 2015 was obtained by converting the number of heads/non-heads of the Census by sex, five-year age group, and family type, into the corresponding numbers of markers/non-markers by sex, five-year age group, and family type.

Men			Women		
S:hS	Single	One-person household marker	S:hS	Single	One-person household marker
S:hO	Single	Other household marker *	S:hO	Single	Other household marker *
S:nh	Single	Non-marker	S:nh	Single	Non-marker
M:hS	Married	One-person household marker **	M:hS	Married	One-person household marker
M:hC	Married	Couple-only household marker	M:hP	Married	One-parent-and-child(ren) household marker
M:hN	Married	Couple-and-child(ren) household marker	M:sp	Married	Spouse
M:hO	Married	Other household marker	M:nh	Married	Other non-marker
M:nh	Married	Non-marker			
W:hS	Widowed or divorced	One-person household marker	W:hS	Widowed or divorced	One-person household marker
W:hP	Widowed or divorced	One-parent-and-child(ren) household marker	W:hP	Widowed or divorced	One-parent-and-child(ren) household marker
W:hO	Widowed or divorced	Other household marker	W:hO	Widowed or divorced	Other household marker
W:nh	Widowed or divorced	Non-marker	W:nh	Widowed or divorced	Non-marker

* Households not including parents

** Include parent-and-child(ren) household markers

Since the transition probability related to institutional household members cannot be obtained due to restrictions on data, we projected the percentage of institutional households by sex, five-year age group, and marital state by extrapolating the trends, as explained later. By applying this to the projected population by sex, five-year age group, and marital state, we obtained the number of private household members. On the other hand, we employed the transition probability matrix between the combinations of marital state and household position shown above to obtain the distribution, from which we obtained the population by marital state and household position (marker/non-marker), by sex and five-year age group. Based on the result at five-year intervals, we obtained the result for each year via linear interpolation. Moreover, we applied the conversion of the procedure at the time when the initial population of 2010 was created in reverse, to obtain the population by sex, five-year age group, marital state, and position within household.

2. Setting of Future Transition Probabilities among Marital States

We first created a tentative transition probability matrix among marital states, based on 2015 Census and the Vital Statistics of Japan. We applied this matrix to 2010 Census, adjusted various probabilities such that the distributions by sex, five-year age group, and marital state of the 2015 Census could be reproduced, and then created a transition probability matrix between marital states corresponding to the period 2010–2015. Using this matrix as the starting point, we created future transition probability matrices between marital states considering changes of probabilities of first marriage, remarriage, divorce/bereavement, and death (five periods from the period 2015–2020 to the period

2035–2040).

The probabilities of first marriage and remarriage of women aged 15-49 were taken from the Population Projections in Japan (medium fertility/medium mortality variant). The probabilities of women aged 50 were obtained by applying trends in younger ages. The probabilities of men were adjusted such that they match the total number of marriages caused by the probabilities of women's first marriage and remarriage. The probability of death was adjusted such that it matches the probability of death in the future life table used in the Population Projection, while maintaining the relative risk by marital states. The probability of divorce/bereavement is the weighted average of the probability of bereavement and probability of divorce. The probability of bereavement was reduced according to the reduction of the probability of death of the opposite sex in the future life table. We assumed that the probability of divorce would be constant after 2015.

3. Projections of Percentage of Institutional Household Members

In the Seventh National Survey on Household Changes ⁵⁾, the pattern of transition among household positions of private household members can be obtained, but data related to transition between private households and institutional households cannot be obtained. For this reason, we projected the percentage of future institutional household members by extrapolating the current trends. We smoothed out the rate of change of the percentage of institutional household members by sex, five-year age group, and marital state obtained from 2010 and 2015 Censuses and applied them until 2040.

4. Creation of Transition Probability Matrix

We obtained the transition probabilities among household positions from the marital transition matrix and the conditional transition patterns obtained from the Seventh National Survey on Household Changes. In this survey, household positions on the survey date as well as five years ago were asked. We performed conversions from heads/non-heads to markers/non-markers on this survey data according to the combinations of marital state and household position defined above. For example, if wives are household heads, they are replaced by husbands and if single children are household heads, they are replaced by parents, placing priority on fathers. We created a transition frequency matrix by sex and five-year age group, for household positions after the adjustment. We omitted very rare transitions to simplify the matrix. From this matrix, we obtained the conditional transition probability for each transition between marital states.

We then multiplied the transition probability among marital states by the thus obtained conditional transition probability to create the transition probability matrix between combinations of marital state and household position, by sex and five-year age group. We multiplied the vector of household positions obtained from the 2010 Census with this matrix and compared the result with the vector of household positions obtained from the 2015 Census, to adjust the transition probability.

5. Initial Population

The initial population, which is the benchmark of the projections, i.e., private household members by sex, five-year age group, and combination of marital state and household position (marker/non-marker) as well as institutional household members by sex, five-year age group, marital state, was obtained from the 2015 Census. The number of people with unknown age, marital states and family type were distributed with iteration procedure. Private household members were obtained by converting heads/non-heads to markers/non-markers according to the aforementioned rules.

6. Projection Results

In the present projections, we first determined the future population by sex, five-year age group, and marital state. We obtained this figure as follows based on the distribution by sex, five-year age group, and marital state in the 2015 Census. We applied the prepared transition probability matrix among marital states to this base data sequentially to obtain the future distribution by marital state, and then multiplied the projected population by sex and five-year age group (medium fertility/ medium mortality) with this distribution. We then applied the prepared projections of the percentage of institutional households by sex, five-year age group, and marital state to this obtained future population to divide the population into private household members and institutional household members.

We started from the aforementioned initial population in 2015 and obtained the future distribution by combination of marital state and household position, by sequentially applying the transition probability matrix. We then multiplied private household members by sex, five-year age group, and marital state obtained above with the thus obtained distribution and obtained the future (five-year interval) population by combination of marital state and household position (marker/ non-marker). Based on this, we obtained the result for each year via linear interpolation, converted it from marker/non-marker to head/non-head, and finally obtained the number of household heads by sex, five-year age group, marital state, and family type. This number of household heads is the projected future number of households.

Notes:

- 1) This report is based on the material published on January 12, 2018.
- 2) The National Institute of Population and Social Security Research, “Population Projections for Japan: 2016–2065, With long-range Population Projections: 2066–2115,” Population Research Series No. 336, July 2017.
- 3) “Other private households” consist of “other relatives households” and “households including non-relatives” in the family type categories of the Census. The latter accounts for as little as 9.2% in 2015. Three-generation households accounts for approximately a half of “other relative households”.
